Education

Cornell University   August 2021 – Present
PhD student
Dr. Frank Pugh Laboratory; Computational Biology

> The Pugh Lab is a leader in developing protocols for high-resolution chromatin immunoprecipitation (ChIP-exo) sequencing. I am currently involved in several projects investigating the fundamental characteristics of chromatin. I have investigated the role of the intrinsically disordered region in the LGE1/BRE1 ubiquitin-depositing complex in yeast, as well as the roles of specific components in the SWR1 H2A.Z-exchange complex. Currently I am working on methods for identifying and characterizing non-canonical transcription factor motifs.

Georgia Institute of Technology   August 2014 – May 2018
BS with Highest Honors
Major in Biomedical Engineering; Minor in Physics
GPA: 3.7/4.0

Experience

Broad Institute of Harvard and MIT – Cambridge, MA
Associate Computational Biologist II   September 2018 – July 2021

> At the Broad Institute, I am a member of the Getz Lab, one of the world's leading labs for cancer genomics. I have worked on several exciting projects pushing at the forefront of the field. One was an analysis of genomic progression in head and neck squamous cell carcinoma (HNSCC). For this project, I made use of a novel set of computational methods to reconstruct the trajectory of genomic events from exome sequencing data. This allowed us to see which mutations and other variants tend to occur early on in the progression of cancer, which will be useful in treatment development and prognosis.

Integrative Systems Biology Lab – Atlanta, GA
Undergraduate Researcher   August 2016 – May 2018

> In the Integrative Systems Biology Lab at Georgia Tech, I worked with Dr. Denis Tsygankov on a project to simulate the biomechanics of solid tumors. For this project, I developed a tool to simulate densely packed cell populations under high pressure using time-evolving Voronoi diagrams, which is useful for analyzing tumor growth under specified conditions.

Publications

- Leshchiner, I.*, Mroz, E.*, Cha, J.*, *et al*. (2023) "Inferring early genetic progression in cancers with unobtainable premalignant disease," *Nature Cancer*. (Accepted)

- Bustoros, M. *et al.* (2020) "Genomic profiling of smoldering multiple myeloma identifies patients at a high risk of disease progression," *Journal of Clinical Oncology*, 38(21), pp. 2380–2389. Available at: https://doi.org/10.1200/jco.20.00437.

Presentations
- "Mutating the intrinsically disordered region of LGE1 in yeast impacts H2B ubiquitination," Cornell Computational Biology student seminar, 2022
- "Mechanisms of Primary and Acquired Resistance to Venetoclax in Chronic Lymphocytic Leukemia (CLL)," American Association for Cancer Research, 2020
- "Genomic landscape of metastatic breast cancer (MBC): comprehensive cell-free DNA analysis from over 10,000 patients and comparison with primary breast cancer," San Antonio Breast Cancer Symposium, 2020

Posters
- "High-resolution characterization of transcription factor binding in S. cerevisiae," Great Lakes Bioinformatics, 2023
- "Inferring early genetic progression in cancers with unobtainable premalignant disease," Massachusetts General Hospital Center for Cancer Research, 2019

Training
- Open Science Grid (OSG) User School; Madison, WI; all expenses paid

Skills
Programming Languages: Python, JavaScript, Julia, SQL, Matlab
Quantitative: Data analysis, Statistics, Genomics
Communication: Technical presentation/writing, Data visualization, Web development, Teaching
